

Dept of Transportation Still Recommending Rabbits Be Burned

February 17, 2010

PETA

Rabbits are locked into full-body restraints and a test chemical is applied to the shaved skin on their back.

Washington DC ([RPRN](#)) 02/17/10
— By searching the Department of Transportation’s website, PETA has uncovered that thousands of rabbits are killed each year in painful toxicity tests required by the Department of Transportation (DOT), despite the approval of a non-animal method known as Corrositex®, **almost 20 years ago.**

In the rabbit test, which is used to test chemicals for corrosivity before they are transported, rabbits' backs are shaved and chemical samples are swabbed onto to their abraded skin and left untreated for up to two weeks—without pain relieving drugs. Corrosive chemicals burn through the skin, and the rabbits are killed after the test period.

In contrast, the non-animal Corrositex® method uses a vial of liquid that changes color when a corrosive material burns through a synthetic skin-like barrier, requiring only several hours to complete. **Corrositex® was the first government-approved non-animal testing method in 1993 and, according to a subsequent press release announcing its government-wide approval, “can fully replace the use of animals for testing corrosiveness” for most classes of chemicals.**

In a series of letters to the Department, including to Secretary of Transportation Ray LaHood in December 2009, PETA cited several interpretation letters it found in which the DOT had advised shipping companies to conduct both the rabbit skin necrosis test and the Corrositex® test, although the latter was intended to replace testing using rabbits and is ***acknowledged by the DOT to be more accurate in many circumstances.***

In one interpretation letter, the DOT writes that, "...the Corrositex® test may be more stringent than the skin necrosis test. If you disagree with the results of the Corrositex® test, we suggest that you perform the skin necrosis test..."

These types of statements by the DOT are not only scientifically unjustifiable and exhibit a clear disregard for extreme suffering of animals, they also present a public safety issue. Since these interpretation letters are made publicly available for clarification, the DOT is setting a dangerous precedent that allows any company to pick and choose which test it will conduct and which results it will rely on for the purpose of classifying a chemical's corrosive nature, rather than requiring that the best science be used.

In addition to urging the DOT to update its guidance to shipping companies so that the rabbit test is no longer recommended, PETA has asked the DOT to clearly post the Corrositex® method on its website and promote it as the preferred test for satisfying DOT's regulatory requirements. PETA has also requested that the DOT adopt internationally-approved guidelines for several newer non-animal methods used to evaluate skin corrosion into its Hazardous Materials Regulations.

To date, the DOT has refused to respond to PETA's inquiries and to reporters on this issue.

About the author:

For more information, please visit <http://www.peta.org>.

People for the Ethical Treatment of Animals (PETA), with more than 2 million members and supporters, is the largest animal rights organization in the world.

PETA focuses its attention on the four areas in which the largest numbers of animals suffer the most intensely for the longest periods of time: on factory farms, in laboratories, in the clothing trade, and in the entertainment industry. We also work on a variety of other issues, including the cruel killing of beavers, birds and other "pests," and the abuse of backyard dogs.

PETA works through public education, cruelty investigations, research, animal rescue, legislation, special events, celebrity involvement, and protest campaigns.
